 **AquaMaps (10/2008):**
Standardized distribution maps for currently 9,000 species of fishes, marine mammals and invertebrates.
AquaMaps is a joint project of [FishBase](#) and [SeaLifeBase](#).

www.aquamaps.org

Kaschner et al, 2008

What are AquaMaps?

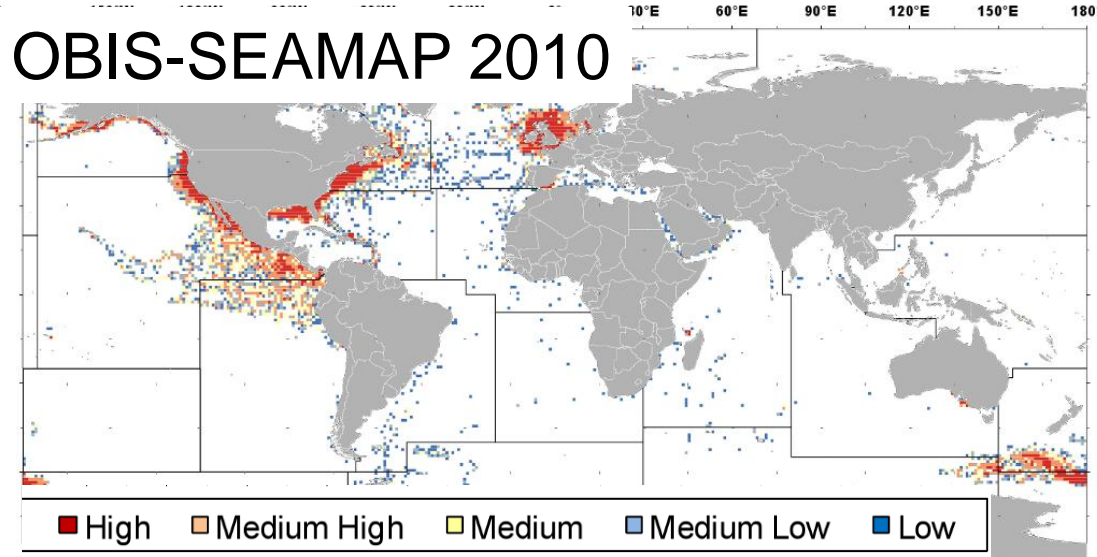

An online marine atlas and species distribution modelling tool aiming to produce computer-generated, reproducible species **range maps** for (eventually) **all species** using **available data** and a **transparent**, easily understandable and modifiable approach, so maps can be reviewed and **improved by species experts**.

→ current taxonomic coverage: **> 11 500 species**

- marine mammals
- fishes
- marine turtles
- invertebrates
- algae
- (seabirds)

WHY?

Marine Mammals: Data Availability

→ 700 000 point occurrence records!!

→ 90 million km² survey coverage

Kaschner et al, accepted
Kot et al, 2010

Marine Mammals: Data Availability

- > 40% of all species with no records
- > 70% of all records from N hemisphere shelf waters

- < 25% of the world's oceans
- < 10 % non-summer surveys
- ~ 10 % of distribution surveyed on average

Marine Mammals: Data Availability

→ not enough data per species to apply standard SDMs

→ non-representative coverage of species ranges

AquaMaps

- Existing online **SDM tool & atlas** covering **> 11 500 species**
- have been **validated** extensively, both on a species level as well as at higher taxonomic levels
- allows investigation of large-scale **biodiversity patterns**, impacts of **climate change** and extrapolation of **densities** in unsurveyed areas
- can help research into **anthropogenic impact assessments** & large-scale, long-term **Marine Protected Area** design in less studied areas such as e.g. the **High Seas**

Marine and Coastal Habitat Data & Validation Tools

Proteus Annual Meeting, London, 14th June 2012

Claire FitzGerald

From a business perspective

- Reducing risk whilst increasing sustainability
- Decision support
- Harmonisation with EIA, risk assessment, coastal sensitivity assessment

Business data needs

- Areas of Ecological Importance
 - Habitats
 - Protected Areas
 - Other spatial regulatory areas
- Human Use
- Oceanographic & physical features

Meeting these needs

- Data of spatial & temporal resolution appropriate to planning
 - Standardised attributes
 - Scalable data
- Use innovative methods to transform the rate of data provision, and data quality
 - Build the tools
 - Build the communities
 - Build the capacity of the communities to use the tools
- Demonstrate utility and value – Pilots projects

Service to Business

- Collect, collate and standardise core data products
- Provide a single point of access for data
- Provide training and guidance to business in using these data and products

Ocean Data Viewer

- Data service for Business
- Platform for future data improvements
- Well documented
- Key data layers
- data.unep-wcmc.org

The screenshot displays the Ocean Data Viewer interface. At the top, it shows '16 DATASETS' and '686 DOWNLOADS'. Below the map, a list of 16 datasets is shown, with 'Global Distribution of Mangroves (1997)' selected. Below the map, a table lists available datasets and their compatibility with various international conventions.

Available datasets	The Convention on Biological Diversity				GEO BON	WSSD	Ramsar Convention	FAO VME
	EBSAs	Islands Biodiversity	Marine & Coastal	Protected Areas				
Global Distribution of Coral Reefs (2010)	✓	✓	✓	✓	✓	✓	✓	✓
Global Distribution of Coral Reefs 1Km data (2003)	✓	✓	✓	✓	✓	✓	✓	✓
Global Distribution of Mangroves (1997)	✓	✓	✓	✓	✓	✓	✓	
Mangroves of East Africa (2003)	✓	✓	✓	✓	✓	✓	✓

Global Seagrass Species Richness (2003)	✓	✓	✓	✓	✓	✓	✓	

Ocean Data Viewer

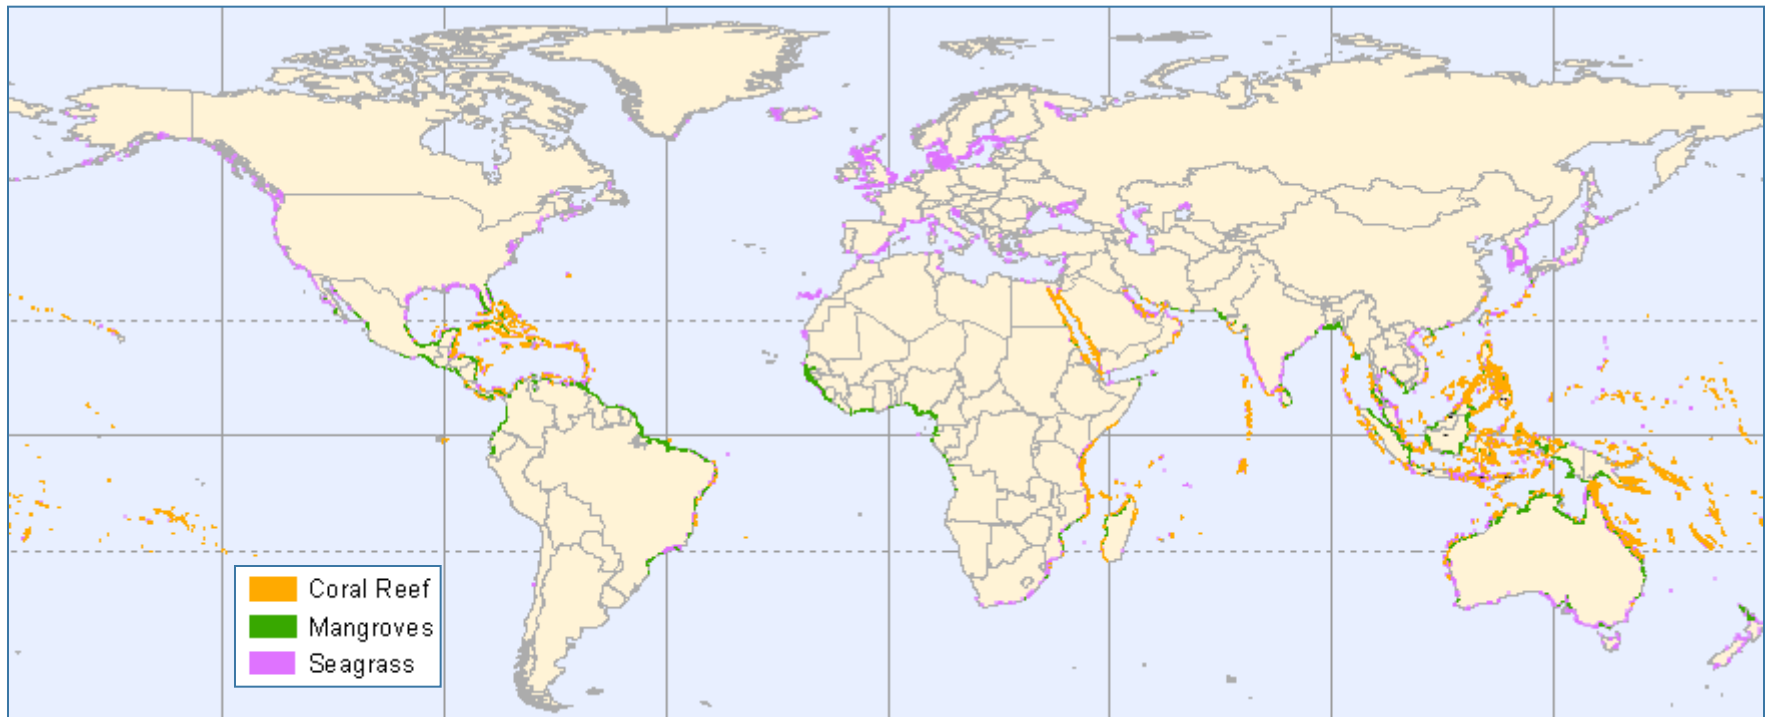

- Help companies avoid and/or minimize threats to biodiversity
- Access to critical site-scale ocean and coastal data
- Allows incorporation of important biodiversity priorities into risk assessment procedures

The screenshot displays the Ocean Data Viewer interface. At the top, it shows '16 DATASETS' and '686 DOWNLOADS'. Below the map, a list of 16 datasets is shown, with 'Global Distribution of Mangroves (1997)' selected. Below the list, a table titled 'Available datasets' provides details for each dataset, including its name and the conventions it aligns with.

Available datasets	The Convention on Biological Diversity			GEO BON	WSSD	Ramsar Convention	FAO VME

Download from Ocean Data Viewer

- Habitat data - Coral Reef, Mangrove, Seagrass

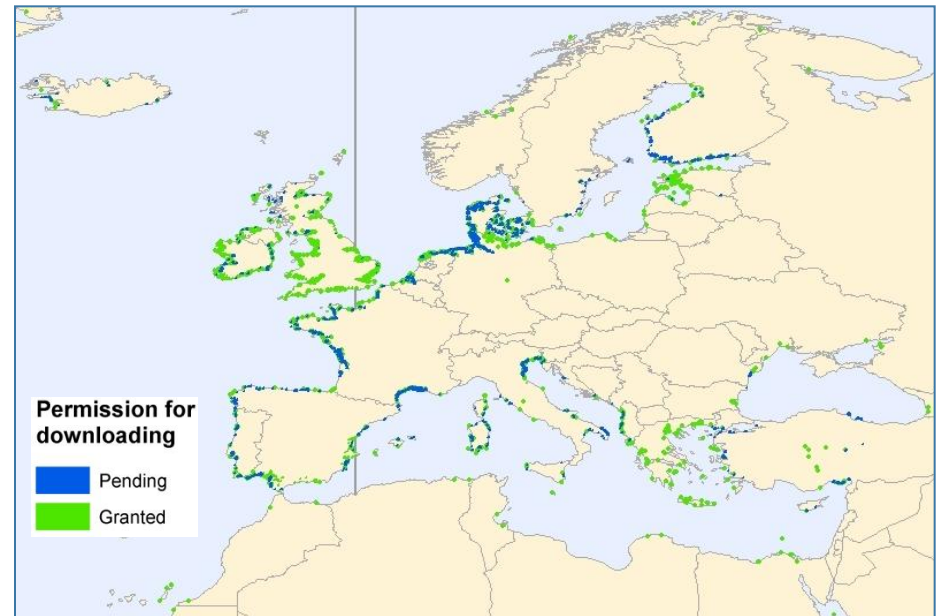

Data improvements – Coral reef

- Highest resolution available global data
- Information from multiple sources have been organised into a standardised format
- Accompanying documentation
- Easy user interpretation

Data improvements – Saltmarsh

- Spatial data updates
 - 24 countries across Europe and South America
 - Adding 8,000 km² to the global saltmarsh dataset
 - Bringing current global saltmarsh estimate to 65,000 km²
 - Work is ongoing

Data improvements – Factsheets

- Available:
 - Coral Reefs
 - Seagrass
 - Mangroves
- Economic and ecological value
- Dataset history and description
- Using this data – why and how
- Metadata
- Data attribute description

Global Distribution of Coral Reefs (2010)

The value of coral reefs – ecological and economic

Healthy coral reefs are among the most biologically diverse and economically valuable ecosystems on earth. They are hotspots of marine biodiversity and for many species they provide habitat, spawning and nursery grounds, as well as being a source of food and protection. They provide valuable and vital ecosystem services such as food, coastal protection, employment through fishing, recreation, tourism and are a source of new medicines.

Coral ecosystems face serious threats. Climate related threats such as mass bleaching and disease; human activities including destructive and unsustainable fishing practices, anchoring and trampling; and the upland activities of deforestation and fertilizer use, all have a detrimental impact on coral reefs. Together, these and other threats are decimating corals faster than they can adapt for survival. The decline and loss of coral reefs have significant social, cultural, economic, and ecological impacts on people and communities around the world. With effective leadership and management, healthy, resilient reef ecosystems can continue to provide these valuable services to current and future generations.

Coral reef data

This global dataset represents mapped coral reef coverage in warm shallow waters of tropical and subtropical regions; cold water corals are not included. It is the most comprehensive global dataset of warm water coral reefs to date, acting as a foundation baseline map for future more detailed investigations. Approximately 85% of this dataset originates from the Millennium Coral Reef Mapping Project (35% validated and 50% unvalidated¹). The validated data correspond to the final standard of Millennium Coral Reef Mapping Project products, and consists of vector spatial data (polygons) with attributes. The contours of polygons and final labels for the unvalidated data, in contrast with the validated products, have not been entirely

¹ Millennium Coral Reef Mapping Project unvalidated maps provided by the Institute for Marine Remote Sensing, University of South Florida (IMARS/USF), with support from NASA. Unvalidated maps were further interpreted by UNEP-WCMC. Institute de Recherche pour le Développement (IRD, Centre de Nouméa) do not endorse these products.

Further improvements

- Global Mangrove Data
 - 1997 World Atlas available to download NOW
 - 2000 UNEP/USGS available end 2012
 - Highest resolution (30m) global dataset
 - Only spatially consistent global dataset
 - USGS updates and final processing underway
 - 2010 World Atlas available to view June 2012
 - for access contact UNEP-WCMC
- Cold coral reef (global) - pending access approval

Data improvements – Standards

- Developed in collaboration with the International Blue Carbon Scientific Working Group (IBCSWG)
- Blue Carbon – carbon stored by coastal and ocean ecosystems such as mangroves, seagrasses and saltmarshes
- Set of standardised core data and metadata attributes for mangroves, seagrasses and saltmarshes
- Result – consistent data
- Finalised core attributes to be tested at pilot sites

Data improvements - Validation

- For all remotely collected information e.g. by satellite, aerial photos; it is necessary to confirm and validate it's accuracy using another data source
- Validation of global habitat datasets never before possible at this scale
- Expert validation based on:
 - Local data
 - Local knowledge
 - Underlying imagery in validation tool
- validation.unep-wcmc.org

Habitat Validation Tool

- Validate, generate and improve coastal habitat spatial extent data online
- Tested with:
 - African subset of the UNEP/USGS Mangroves (2000)
 - Global Coral Reefs (2010)
 - Saltmarsh mapping online
- User edits incorporated into the online layer

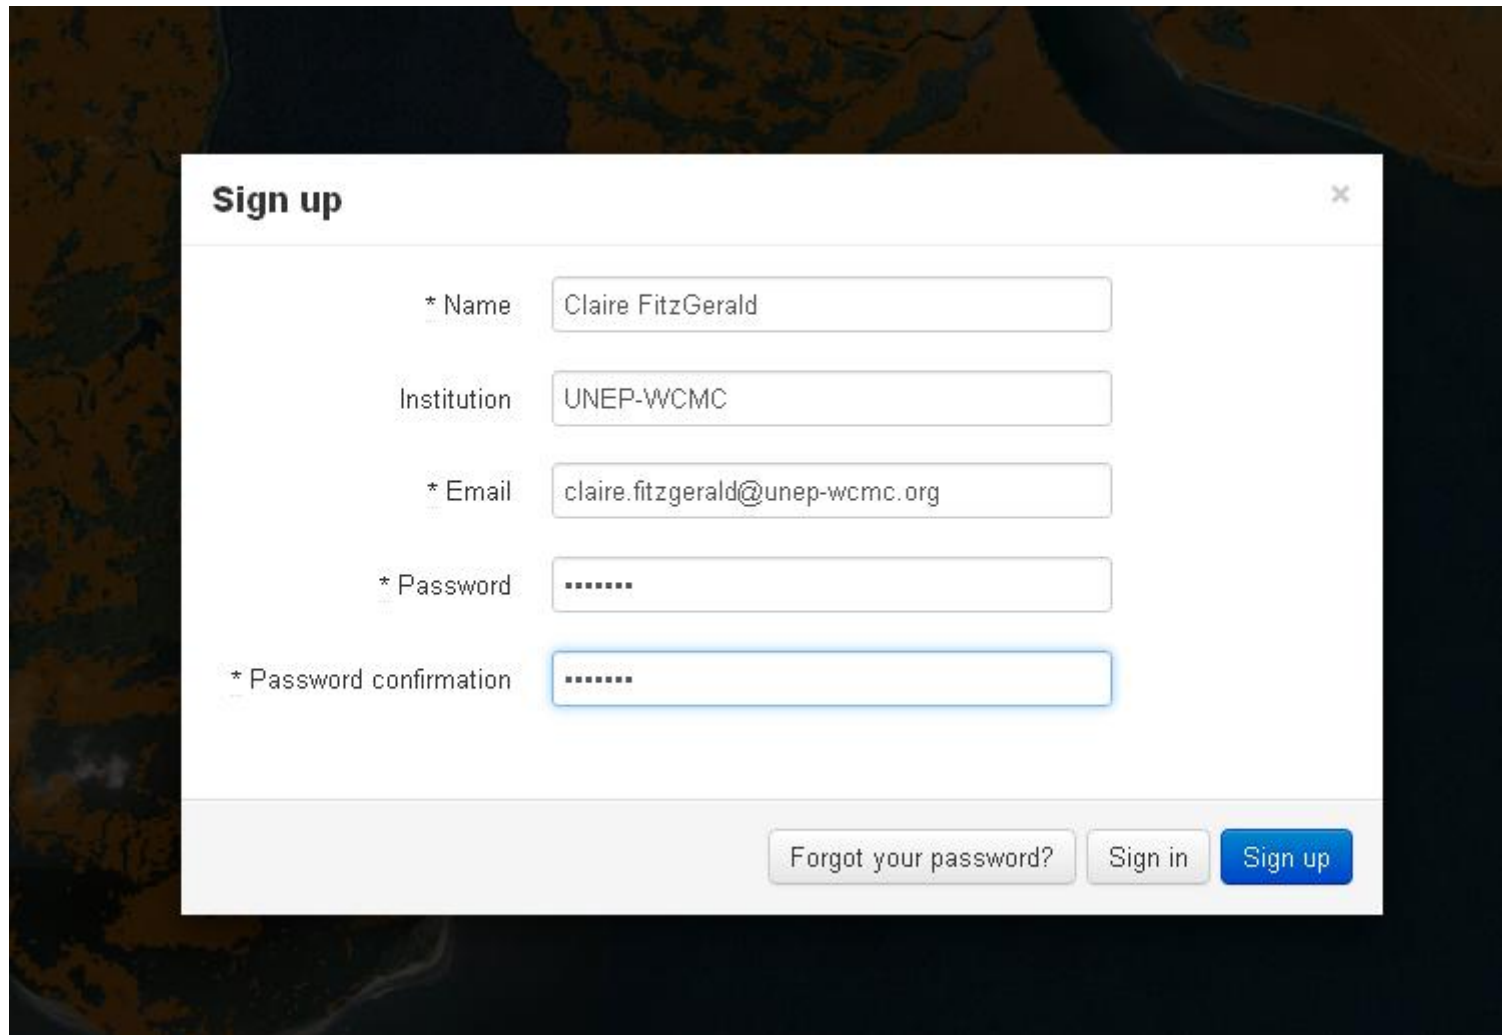

Zoom in to begin editing

The screenshot displays the 'Habitat validation tool' interface. On the left, a control panel includes a 'Mangroves' dropdown menu, a legend with 'Original' (orange), 'Validated' (green), and 'Added' (blue) categories, 'Satellite' and 'Hybrid' map style buttons, and zoom controls (+, -, and a question mark icon). The main map area shows a satellite view of a mangrove wetland with orange overlays indicating validated areas. On the right, a floating menu contains 'Validate' (green), 'Add New' (blue), and 'Delete' (red) buttons, followed by a dropdown menu with options: 'Local data', 'Please select evidence type', 'Underlying imagery in browser', 'Local data' (highlighted), and 'Local knowledge'. The bottom of the interface features the Google logo, the UNEP WCMC logo, and a copyright notice: 'Imagery ©2012 DigitalGlobe, GeoEye - Terms of Use'.

Select evidence type and area to validate

The screenshot displays the 'Habitat validation tool' interface. The main map shows a coastal area with orange-colored mangrove habitats. A blue polygon with white vertices is drawn over a portion of the mangroves, indicating a selected area for validation. The tool's control panel includes a dropdown menu set to 'Mangroves', a legend with 'Original' (orange), 'Validated' (green), and 'Added' (blue) categories, and buttons for 'Satellite' and 'Hybrid' imagery. On the right, there are buttons for 'Validate', 'Add New', and 'Delete', along with a dropdown for 'Underlying imagery in browser' and 'Submit'/'Erase' buttons. Logos for Google, UNEP, and WCMC are visible at the bottom.

Habitat Validation Tool - Future

- Validate additional global datasets
 - Seagrass
 - Mangrove
- Upload spatial data
 - for integration into the online dataset
- Download online version
 - accompanied by official static version
 - according to user defined area of interest
- Online habitat change detection
 - Multi-date imagery

Data Improvements – Networking and Partnerships

- Building data improvement networks using online validation tools
- Promotion of UNEP-WCMC's *Better Data, Better Decisions* initiative
- Habitat Validation Tool launched May 22nd, International Day for Biological Diversity
- Further events - Conference of the Parties (COP 11) to the Convention on Biological Diversity (CBD), Hyderabad 1-19 Oct 2012

Better Data, Better Decisions

.....
A global data partnership to transform coastal ecosystem monitoring and assessment
